Washingtonia robusta

(*W. gracilis*, *W. sonorae*)

(Mexican Fan Palm)

Arecaceae (*Palmae*) Palm family

Origin: Southern California and Mexico

wosh-ing-TOE-nee-uh
roe-BUS-tuh

Species characteristics:

Form - Fan Palm. Very fast growing to over 90', slender, erect. Tallest of all palms in this region.

Trunk - Brown bases of frond stalks remain for many years, forming a skirt of thatch. The remaining frond stalk parts form a distinctive series of vees along the whole trunk. When the lower portion drops off with age, the clean trunk is smooth and gray.

Foliage - Has deep glossy fronds with a saw tooth stalk and a reddish streak on lower sides.

Flowers/fruit - Flowers are small, white to cream white. 1/4" in size growing on long stalks in clusters 2 - 3' long. A mature tree will produce many purplish blue fleshy fruits, each containing a 1/8" black seed.

No significant pest problems are known at this time.

Site suitability:

Sunset zones - 8, 9, 11 - 24 and the warmer parts of 10.

Clearances - Suitable for 3' minimum parkways, medians or cutouts.

Good for street sides, medians, parks, lawns, in groups and as accent trees.

Culture considerations:

The many fruits and self-seeding can be a nuisance. Tolerates coastal exposure, drought and poor soils, however, will do best in inland areas with heat.

Comments, notes:

Ginkgo biloba

GINK-goe
bye-LOE-buh

(Maidenhair Tree)

Ginkgoaceae (Ginkgo family)

Origin: Eastern China

Species characteristics:

Form - Deciduous. Slow growing, long lived tree. Erratic growth, sometimes asymmetrical, when young. Shape variable in maturity with height to 60', and occasionally more, and spread 20 - 40'.

Trunk - Bark is light gray, turning darker and furrowed with age..

Foliage - Leaves are leathery, light green, broad fan shaped 1 - 4" wide, turning golden in the fall. Persistent golden foliage then drops to form a golden carpet beneath the tree. Two-lobed leaflets are shaped like those of Maidenhair Fern.

Cultivars - Specify male grafted or male cutting stock, as female tree produces large quantities of messy, foul smelling fruits. All cultivars are grafted male trees and should be used when uniformity is desired. 'Autumn Gold' is upright, evenly broad shaped. 'Fairmont' is slow growing to 45', with a moderately pyramidal crown. 'Princeton Sentry' has narrow growth form and a straight trunk.. 'Saratoga' is smaller than others and densely pyramidal. 'Shangri La' has a compact growth habit, dense, full crown and more rapid growth than most Ginkgos, has brilliant yellow foliage under most fall conditions.

No significant pest problems are known at this time.

Site suitability:

Sunset zones - 1 - 10, 12, and 14-24.

Clearances - Suitable for 5' minimum parkways, medians or cutouts.

Good for street sides, medians, parks and lawns.

Culture considerations:

Tolerant to all soils, air pollution, high wind and drought. Maximum growth in well-drained soils.

Comments, notes:
