

APPENDIX A

PUBLIC PENSION PRINCIPLES

In Los Angeles County, there are 277 public pension systems that offer a wide variety of pension alternatives to local government jurisdictions. These systems generally fall into one of three categories:

- 1) The County of Los Angeles provides pension benefits to its employees under the County Employees Retirement Law of 1937 (CERL). This law sets forth the policies and regulations governing the actions of county retirement systems. The County's pension plan, LACERA, was established under CERL in 1938.
- 2) Some cities and special districts have established individual pension plans created by charter. For example, the City of Los Angeles operates three plans for its miscellaneous employees, its fire and police employees, and its Department of Water and Power employees. As with the County, the City's plans were established in 1938. Dates when individual pension plans were established in other jurisdictions vary.
- 3) Some cities and special districts choose to participate in the California Public Employees Retirement System (CalPERS) plan, which is governed by State law. Local government jurisdictions were permitted to join the State pension system through the State Employees Retirement System (SERS) beginning in 1939. SERS later became CalPERS.

PENSION LAWS AND STANDARDS OF REPORTING

Within the context of enabling constitutional and statutory permissions, jurisdictions may tailor the benefits it provides to its employees. Typically, this is done through the collective bargaining process. Once benefits are defined for active employees or pensioners, the law generally prohibits public agencies from unilaterally reducing such benefits, except for new employees. According to the United States Government Accountability Office (USGAO):

All states have legal protections for their pensions. The majority of states have constitutional provisions describing how pension trusts are to be funded, protected, managed or governed. The remaining states have pension protections in their statutes or recognize legal protections under common law. Legal protections usually apply to benefits for existing workers or benefits that have already accrued; thus, state and local government generally can change the benefits for new hires. In contrast to pensions, retiree health benefits generally do not have the same constitutional or statutory protections. Instead, to the extent retiree health benefits are legally protected, it is generally because they have been collectively bargained and are subject to current labor contracts.^{▽*}

[▽] January 2008, GAO-08-223 State and Local Government, Report to the Committee on Finance, U.S. Senate, State and Local Government Retiree Benefits Current Funded Status of Pension and Health Benefits

* Article 16, Section 17 of the California Constitution defines the fiduciary and investment roles, powers and authorities of public pension boards. The California Government Code generally governs public pension systems for State and local government employees, including Section 31450 et al, also known as the *County Employee Retirement Law*, or CERL

In addition, various sections of California State law require that public pension systems annually prepare financial statements that conform to professional auditing standards. For example, California Government Code Section 31598 establishes the following financial statement requirement for counties that have retirement systems governed by CERL and retirement trust funds managed by county treasurers: “The annual statement shall be prepared in accordance with generally accepted accounting principles on the basis of pronouncements of the Government Accounting Standards Board (GASB) or its successor organization.”

Further, the USGAO has made the following observation, “many state laws require local governments to follow GASB standards, and bond raters do consider whether GASB standards are followed. Also, to receive a ‘clean’ audit opinion under generally accepted accounting principles, state and local governments are required to follow GASB standards. These standards require reporting financial information on pensions, such as contributions and the ratio of assets to liabilities.”^v

These practices are followed in California to ensure financial reporting transparency with public pension plans. Generally, we found this to be the practice in Los Angeles County, but we also found that access to this information is sometimes difficult. As mentioned previously in this report, approximately 25 jurisdictions did not respond to repeated telephone calls to try and obtain needed documents, and research indicated that in some jurisdictions, such as the City of Bell, current financial statements were not available. In a small number of cases, we found inconsistencies between the jurisdictions’ financial statements and those prepared by the plan, which could not be explained by representatives from the jurisdictions. Lastly, our experience with CalPERS makes us question whether that organization may have purposely created administrative hurdles when detailed information was requested for their member agencies (see the *Introduction* to this report).

Despite the difficulties experienced when collecting data for this assessment, in California, the laws have been structured in a manner that provides a strong foundation for pension system governance and transparent reporting, as summarized below:

- The roles, powers and authorities of public pension system boards are defined in the State Constitution.
- State statutes have been enacted that define the structure and provide for the regulation of public pension systems in California, including those related to: 1) CalPERS and its role providing pension services to local governments; 2) CERL, which defines the authorities and rules surrounding individual county pension systems; and, 3) various sections that establish minimum financial reporting requirements for public pension plans established within the State.

These state laws are supplemented by the rules that are found in many city charters, as well as the contractual agreements that jurisdictions enter into as part of their collective bargaining process with employee unions.

^v January 2008, GAO-08-223 State and Local Government, *Report to the Committee on Finance, U.S. Senate, State and Local Government Retiree Benefits Current Funded Status of Pension and Health Benefits*. At the time of the USGAO report, GASB was just beginning to require public sector agencies to “quantify and report” on the size of retiree health care benefit liabilities (GASB 43 and 45). All financial statements reviewed as part of this assessment are now reporting AAL, UAAL and Annual Required Contributions (ARC) for their OPEB plans.

FINANCIAL AFFECT OF BENEFIT DESIGN AND ACTUARIAL ASSUMPTIONS

Most public pension plans in the County are *defined benefit plans*, with the exception of certain plans established for part-time, seasonal and some management employees, which are typically *defined contribution plans*.

Defined benefit plans require that jurisdictions contribute an actuarially determined amount to fund guaranteed member benefits at retirement. The contribution amount can vary significantly from year to year due to economic conditions and various factors affecting actuarial estimates of liabilities and assets, including changes to actuarial cost methods; investment return, cost of living, and retirement age assumptions; amortization policies used to account for unfunded liability; and other factors. Defined contribution plans merely require jurisdictions to contribute a set amount per employee (e.g., 3% of salaries). Like a private sector 401(k) plan, under defined contribution systems, risks associated with investment gains and losses are borne entirely by the employee with no guaranteed pension at retirement.

Defined Benefit Design Variables Affecting Costs

Various factors can influence estimates of funded status, contribution requirements and the ultimate cost of defined benefit plans. Some of the more significant factors are described below:

Base Compensation Formula	Most plans compute the base retirement benefit by multiplying a percentage of the employees' final average salary (FAS) times the number of years of service credit. For example, an employee who has 30 years of service credit and received 2% of salary for each year of service at retirement age, would receive a retirement benefit of 60% of his or her final salary.
Normal Retirement Age	Plans specify the age at which employees may retire with full benefits. If an individual retires before or after attaining that age, the percentage of salary is often adjusted. For example, if an employee is a member of a "2% at 60" plan, and is credited with 30 years of service, she may have her benefit reduced if she retires earlier or increased if she retires later. As one example, the CalPERS 2% at 60 Miscellaneous Pooled Plan discounts the percentage rate to 1.460% at 55 but increases it to 2.418% at 63 or older.
Years of Service	Depending on the plan, the years of service used to compute retirement may be increased above the number of years that the employee actually worked for the agency. Typical factors allowing years of service credit to be increased include: a) sick leave buy-back, up to the maximum allowed by federal law; b) military time credit; c) other government service time; and d) "air time", which is additional un-worked time that may be purchased at cost by the employee (a critique of air time and public agency financial exposure is discussed later in Section 1 of this report).

Final Average Salary	Different methods of calculating Final Average Salary (FAS) can impact the amount of pensionable salary ^v that is used to compute employee benefits. Three different methods are typical: a) the average pensionable salary earned during the final 12-months of employment; b) the average of the 12 highest months of pensionable salary earned during the final 36-months of employment; and c) the average of the 12 highest <u>consecutive</u> months of pensionable salary earned during the retiree's career. Instances of "pension spiking" may be more frequently encountered with the formulas that use the final twelve month salary period as the base.
Pensionable Salary	Federal law restricts the categories of salary that can be used for recruiting pension benefits. For example, with the exception of overtime earned under the Fair Labor Standards Act (FLSA), overtime that is generally excluded. However, other types of income may be included, such as reported income for pay differentials (e.g., "longevity pay", special certification pay, etc.) and the taxable income reported to the Internal Revenue Service when assigned a take home vehicle. As a result, there can be different impacts on pension costs for employees that fall into employee groups that receive special categories of pay, such as uniformed personnel and executive management groups. Often, individual retirees who receive the highest levels of compensation relative to their base salary fall into one of these groups.
Benefit Caps	Plans cap the amount of benefit payments that retirees may receive at a percentage of FAS. In many cases, this percentage cap is set at 100% of the FAS. Other plans may set it lower. For example, the Los Angeles Police and Fire Plan sets a cap of between 66 2/3% and 90% of FAS depending on benefit tier and years of service. Pension benefits may be raised above these levels if employees made contributions through payroll deductions during employment.
Optional Benefits	Some plans offer optional benefits to employees, including survivor benefits. Depending on how these optional benefits are designed, the exposure to the agency may differ. For example, some plans do not offer survivor benefits or merely provide a refund of the employees' payroll contributions to spouses or other beneficiaries when the retiree dies. Other plans may provide pension continuation provisions for spouses as a standard benefit, typically set at 50% or more of the retiree's benefit amount.
Cost of Living Adjustments	Most plans include cost of living adjustment (COLA) guarantees for their retirees. These can significantly impact the future cost of benefits if the COLA exceeds actual inflation. For example, CalPERS provides member agencies with a baseline

^v By federal law, only certain categories of salary may be used to calculate pension benefits. For example, most overtime pay is excluded, significantly limiting the pensionable salary for police and fire employees.

	2% COLA for retirees, but agencies may elect to purchase COLAs of up to 5% per year. Generally, COLAs are a negotiated part of benefits chosen through the collective bargaining process with employees.
Employee Contribution Pickup	Many jurisdictions have agreed to "pick-up" the cost of all or a portion of employee contributions. These costs can be significant. For example, CalPERS charges miscellaneous employees 7% of salaries and safety employees 9% of salaries. If picked up by the member agency, this cost is no longer borne by the employee.

Financial Affect of Actuarial Assumptions and Methodologies

In addition to benefit design, actuarial assumptions and methodologies can impact the total assets and liabilities being projected for a jurisdiction. The following table describes some of the key assumptions considered by actuaries when conducting the analysis.

Investment Return	When projecting forward, actuaries will use an assumed rate of investment return to estimate long term growth in fund assets. These investment returns essentially reduce, or discount, the required contribution to be made by the jurisdiction to fund benefits for its employees. During the period of this assessment, CalPERS member agencies had an assumed rate of return of 7.75% on assets, while many other funds had assumed interest rates of return of 8.00%. Additionally, after a formal review of its assumed rate of return, LACERA maintained its assumption of 7.75% in an October 2010 decision. Reductions in the assumed rate of return, as implemented by LACERA, will require offsetting increases in jurisdiction contributions, as discussed later in this report.
Investment Smoothing	Short-term investment earnings are "smoothed" by actuaries to moderate fluctuations in <i>actual</i> returns. Such smoothing effectively distributes investment gains and losses over periods longer than a year so that the impact of annual gains and losses are spread over a longer period. Many non-CalPERS plans have set the smoothing period at 5 years, but the range of smoothing can differ. For example, until 2009, LACERA smoothed its investment returns over 3 years, but then changed its policy to 5 years. In 2005, CalPERS changed from a 5 year smoothing policy to 15 years in response to member agency concerns about contribution rate stabilization.
Smoothing Corridors	Smoothing corridors are established by some plans to ensure that abnormal investment gains and losses are recognized more immediately and not smoothed over longer periods. This avoids instances where large actuarially valued asset balances may accumulate or losses may threaten plan solvency, with the goal of moderating contribution rates for the sponsoring agency. For instance, CalPERS policy prior to 2009 was to smooth investment gains and losses over 15 years when they fell within 80% and 120% of the assumed rate of return. When

	actual investments returned a 24% <u>loss</u> in 2009, the CalPERS Board temporarily broadened the smoothing corridor: (a) to between 60% and 140% for FY 2010, and (b) 70% to 130% for FY 2011. CalPERS will return to the 80% to 120% corridor in FY 2012.
Amortization of UAAL	Annual gains and losses experienced by pension plans are typically amortized over periods ranging from 15 years to 30 years, depending on the plan. These are generally segregated by cause, including impacts from plan amendments, changes in actuarial assumptions and methodology, and gains and losses. This can have a significant impact on a jurisdiction's contribution rate. For example, the City of Hermosa Beach plan for miscellaneous employees will require that the employer contribute 16.036% of pensionable salaries in FY 2011-12. Of this amount, 7.832%, or nearly half of the City's required contribution, was due to the amortization of unfunded liability.
Inflation	When projecting future pension cost increases, actuaries estimate rates of inflation. Depending on the jurisdiction, these inflation rates can vary. For example, CalPERS estimates inflation at 3.0%, while LACERA estimates inflation at 3.5%.
Salary Growth	In addition to inflation, actuaries include assumptions related to salary growth for plan members. These are generally based on category of employee, entry age into the plan and duration of service. In addition to increases in salary due to promotions and longevity, the increases typically include an assumed per annum rate of increase in the general wage level of membership. For example, LACERA actuaries assumed annual salary growth of between 4.26% and 10.24% in its most recent actuarial analysis.

In addition to these key variables, there are many others that actuaries use to assess plan assets and liabilities. For example, the number of years between normal retirement age and assumed mortality can have a dramatic affect on costs, such as when many safety plans in CalPERS moved from their 3% at 55 retirement plans to 3% at 50 retirement plans in the early part of the 2000's. This essentially added five benefit years for individuals who chose to retire earlier than they may have under their prior plan, increasing contribution requirements.

OTHER NON-REPORTED COSTS

In addition to pension costs, jurisdictions may offer employees retirement benefits or incur costs that are not administered or reported as part of the retirement system. These fall into three general groupings.

Other Post Employment Benefits (OPEB)

OPEB are retiree health insurance benefits that, like pensions, may be structured as (a) defined contribution plans, where employees will have an account that can be used to subsidize health insurance costs after retirement; or, (b) defined benefit plans, where the jurisdiction promises to pay the full cost or a percentage of the full cost of health insurance benefits for the employee after retirement. Until 2008, jurisdictions were not required to prepare actuarial analyses of

OPEB liability. Beginning in that year, jurisdictions began reporting this information in accordance with GASB Statements 43 and 45.

In many instances, unfunded OPEB liabilities are significant. As discussed in this report, most jurisdictions in Los Angeles County are only contributing amounts equal to their annual cost of benefits (i.e., pay as you go) and are not contributing amounts for reserves to fund future costs. This approach has the potential to create a crisis for public jurisdictions. First, as employees with this benefit retire at faster rates due to "baby boomer" aging spikes, the current cost of benefits will increase proportionately. Second, health care and insurance costs continue to escalate at a much faster rate than inflation, particularly for older persons, increasing the likelihood that individual employee retiree health benefit costs will outpace inflation. Third, the uncertainty surrounding the impacts from national health care make estimates of future cost increases difficult to predict, so it would be prudent to set aside reserves to ensure that future costs are covered under the new dynamics in health care.

For each jurisdiction in the County, we have reported the UAAL for OPEB benefits, which presently amounts to at least \$33.9 billion for all jurisdictions. In this report, we recommend strategies that might be employed by these jurisdictions to reduce the future cost for this benefit.

Pension Obligation Bonds (POBs)

Since approximately 1985, some jurisdictions have borrowed funds using Pension Obligation Bonds to pay down the unfunded liability in their pension funds. POBs are typically general obligation debt, meaning that the borrowing is secured by the general taxing authority of the jurisdiction.^v The intent is to borrow funds at interest rates that are lower than the pension funds' assumed and actual rate of return and to earn net pension fund investment earnings that exceed the total cost of the POB borrowing. If this occurs as planned, over the term of the POB, the total cost to the jurisdiction will be lowered.

The Government Finance Officers Association of the United States and Canada (GFOA) warns public agencies to use caution when deciding to borrow funds using Pension Obligation Bonds. In an Advisory entitled *Evaluating the Use of Pension Obligation Bonds*, the GFOA states:

Governments issuing pension obligation bonds should compare the bond's debt service schedule to the pension system's current UAAL amortization schedule, using the true interest cost of the bond issue as the discount rate to calculate the estimated net present value savings. Additionally, issuing governments should consider the amount of the net present value savings, the spread between the true interest cost of the bonds, and the actuarial investment return assumption of the pension plan.

Even if the analysis indicates that financial benefits appear to outweigh the risks, government should evaluate other issues that may arise if the bonds are issued, such as the loss of flexibility in difficult economic times because of the need to make timely payments of principal and interest in order not to default on the bonds, potential misunderstanding by policy makers regarding the possibility that an unfunded liability may appear in the future, and potential pressure for additional benefits for government employees if plans are fully funded and the government's contribution as a percentage of payroll has declined relative to neighboring jurisdictions.

It is for these and other reasons that POB debt should be reported as a pension obligation that falls outside of the normal reporting responsibilities of the pension system.

^v March 2011, *Pension Obligation Bond Financing*, Orrick, Harrington & Sutcliffe, LLP. According to Orrick, POBs "are issued under the local agency refunding law . . . and considered valid without a vote under a judicially created exception to the State constitution Article XVI, Section 18 debt limitation referred to as 'obligations imposed by law'".

SOCIAL SECURITY CONTRIBUTIONS

When evaluating the cost of public pension benefits for Los Angeles County government employees, it is important to recognize that many of these employees are exempt from Social Security. The impact of these exemptions are twofold: (1) The exempt employee will not be able to rely on Social Security benefits to supplement other pension income at retirement, since the employee will not be eligible to receive credit for Social Security benefits for those years spent working for the exempt government agency; and, (2) neither the employee nor the employer are required to pay Social Security payroll taxes, saving the exempt employee and employer considerable amounts in payroll taxes each year.

Since 1990, Social Security payroll taxes have been set at 6.2% of payroll for both employers and employees, up to a maximum earnings limit.^v In 2011, this earnings limit is \$106,800. As part of the *Recovery and Reinvestment Act* of 2010, the rate of contributions for employees was reduced to 4.2% in 2011, returning to 6.2% in 2012. However, for employers, the rate remains at 6.2% throughout this period.

For government agencies whose workers are exempt from social security, the budget savings from this exemption can be significant. For example, County of Los Angeles employees are exempt from Social Security payroll taxes, as are uniformed employees of fire and police agencies in other jurisdictions within the County. Assuming 80 percent of LACERA's \$6.7 billion in pensionable payroll fell below the \$106,800 income cap in 2010, the County was exempted from paying over \$332 million in Social Security taxes in that year. Accordingly, the pension contribution cost being incurred by public agencies within the County, should be balanced against this substantial offset.

INDICATORS OF PENSION SYSTEM STRENGTH

It is because of the many reasons cited in this Appendix that it is difficult to make direct comparisons of the population of pension plans across jurisdictions. The USGAO, when making this same observation in 2008, stated that "Because a variety of methods and actuarial assumptions are used to calculate the funded status, different plans cannot be easily compared."^{*}

In that same report, the USGAO made two other important observations.

First, the USGAO stated that there are "three key measures "that help to understand different aspects of the funded status of state and government pension and other retiree benefits."

1. Whether jurisdictions have been making their required annual contribution, as a sign that they are capable of funding the benefits promised to employees;
2. The strength of a plan's funded ratio, as a measure of the percentage of actuarially accrued liabilities that are covered by actuarially valued assets; and,

^v April 20, 1983, *Public Law 98-21*, and as summarized in the 1983 *Greenspan Commission on Social Security Reform, Appendix K, Table 2A*

^{*} January 2008, GAO-08-223 State and Local Government, *Report to the Committee on Finance, U.S. Senate, State and Local Government Retiree Benefits Current Funded Status of Pension and Health Benefits*

3. The unfunded actuarially accrued liabilities reported in dollars, which can be compared with a jurisdiction's total covered payroll.^v

Second, that these three measures "should be reviewed over time to understand how the funded status is improving or worsening." The USGAO further states that, "Many experts consider a funded ratio of 80 percent or better to be sound for government pensions."

In our view, these last two observations are key to understanding the severity of the current pension "crisis" spoken about in the press. While the current challenges facing local government are serious, most plans in the County have demonstrated a history of maintaining funded status well above this 80 percent threshold; and already, after the first full year of investment recovery, many plans have risen back above this mark, including LACERA (83.3% in 2010), the Los Angeles Fire and Police Pension Plan (91.6% in 2010), the Los Angeles Department of Water and Power Retirement Plan (81.5% in 2010), and others.

^v For example, in 2010, the Los Angeles Department of Water and Power Retirement System reported UAAL of over \$1.6 billion, which was 192.6% of its annual covered payroll of \$856 million. LACERA, on the other hand, reported much greater UAAL of \$7.8 billion. However, this amount was only 116.6% of its covered payroll of \$6.7 billion.
